```

Antigens derived from the present human Fas ligand sequence can be used in the preparation of a neutral antibody against an apoptosis inducing Fas ligand. The antibody can be used in a Fas ligand assay, e.g. an enzyme linked immunosorbant assay, to diagnose diseases in which the Fas ligand/Fas antigen system is implicated, e.g. hepatitis B/C, human immunodeficiency virus, graft/host disorders, ulcerative colitis or sequelae of myocardi infarction. The antibody may also be used to treat such diseases

myocardial diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     complexes and LT heterotrimeric complexes are useful as inhibitors of signalling by TNF receptors (R) and TNF-related receptors, such as CD40, FAS and LT-beta receptors. By inhibiting TNF-R signalling the complexes (esp., LT-alpha2/beta1) can be used for treating autoimmune diseases including diabetes, rheumatoid arthritis, inflammatory bowel disease and HIV proliferation, known to be improved by TNF inhibition. The complexes are also useful for preventing or reducing the severity of an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence comprises the C-terminal extracellular domain of the Fas ligand altered to drive trimerisation with wild-type lymphotoxin (LT)-beta. LT subunit association domains potentiate subunit associations into an active trimeric ligand. Tumour necrosis factor (TNF)-related ligand monomers mutated in their respective subunit associations domains can form heteromeric complexes with LT subunits. LT-alpha/beta heteromeric

LT subunit association domains potentiate subunit associations to an active trimeric ligand. Tumour necrosis factor (TNF)-related ligand form heteromeric complexes with LT subunits. LT-alpha/beta heteromeric complexes and LT heterotrimeric complexes are useful as inhibitors of signalling by TNF receptors (R) and TNF-related receptors, such as CD40, FAS and LT-beta receptors. By inhibiting TNF-R signalling the complexes (esp., LT-alpha/beta) can be used for treating autoimmune diseases including diabetes, rheumatoid arthritis, inflammatory bowel disease and HIV proliferation, known to be improved by TNF inhibition. The complexes are also useful for preventing or reducing the severity of an immune response to a tissue graft.

CC bound signaling molecules or receptors or is an antibody (or its containing molecules or receptors or is an antibody (or its containing as component B CC aprotein of the Clq or collectin families; (b) DNA sequences (II) that CC encode the FP of (a); (c) expression vectors containing (III); (d) host CC cells containing the vector of (c); and (e) (II) in which component B of CP is derived from the immunoglobulin, Clq or collectin families of proteins. The products of the invention have antiinflammatory, antiprotozoal, antitumor and endocrinological activity. (I) CC antimalarial, antiprotozoal, antitumor and endocrinological activity. (I) CC are useful, in human or veterinary medicine, to: (i) produce pharmaceuticals for treatment of inflammation; autoimmune diseases; (particularly of the lymphatic system) and/or endocrinological disorders; (ii) produce vaccines for active or passive immunization against CC infections (specifically rubella, measles, poliomyelitis, rables, CC virus or influenza), also as vaccine adjuvants; or (iii) for in vitro CC diagnosis. Crosslinking of component A is now achieved without requiring CC activity and regeneration of activity. This sequence represents the Fasi CC trimer construct described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel dimers or oligomers (I) of di-, tri-, tetra- or penta-mers (II) of recombinant fusion proteins (FP) comprising tetra- or penta-mers (II) of recombinant fusion proteins a loilogically active protein (or fragment) and B is a protein (or fragment) that causes dimerization/oligomerization of (I) without regulring a third molecule. Particularly A functions as a ligand for antibodies, soluble or membrane

                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunomodulatory, antiapoptotic, apoptotic, antiviral, antibacterial, antimunomodulatory, antiapoptotic, apoptotic, antiviral, antibacterial, antimalarial, antipotozoal, antitumor and endocrinological activity. (I) are useful, in human or veterinary medicine, to: (i) produce pharmaceuticals for treatment of inflammation; autoimmune diseases; hyper- or hypo-apoptotic states; infections (particularly viral); tumors (particularly of the lymphatic system) and/or endocrinological disorders; (ii) produce vaccines for active or passive immunization against infections (specifically rubella, measles, poliomyelitis, rabies, tetanus, diphtheria, BCG, malaria, yellow fever, human immune deficiency virus or influenza), also as vaccine adjuvants; or (iii) for in vitro diagnosis. Crossilnking of component A is now achieved without requiring a third molecule (e.g. antibody), resulting in increased biological activity and regeneration of activity. This sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   particularly A functions as a ligand for antibodies, soluble or membrane bound signalling molecules or receptors or is an antibody (or its fragment). The invention also describes (a) FP containing as component B a protein of the Clq or collectin families; (b) DNA sequences (II) that encode the FP of (a); (c) expression vectors containing (III); (d) host cells containing the vector of (c); and (e) (II) in which component B of FP is derived from the immunoglobulin, Clq or collectin families of FP is derived from the invention have antilinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel dimers or oligomers (I) of di-, tri-, tetra- or penta-mers (II) of recombinant fusion proteins (FP) comprising at least one each of components A and B, where A is a blologically active protein (or fragment) and B is a protein (or fragment) that causes dimerization/oligomerization of (I) without requiring a third molecule.
                                   Human; Fas ligand; Fas ligand-fusion protein; leucine zipper; transmembrane protein; hepatotropic; immunosuppressive; apopt liver cell necrosis; viral hepatitis; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New dimers or oligomers of oligomeric recombinant useful as pharmaceuticals and vaccines, comprises and component that induces oligomerization -
                                                                                                             FLAG peptide-Leucine zipper-human Fas ligand fusion protein.
                                                                                                                                                     20-MAR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     super-FasL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tschopp J,

The fusion protein contains: (1) a FLAG peptide sequence; (2) an leucine zipper sequence; and (3) the extracellular domain of human Fas ligand. The fusion protein has hepatotropic and immunosuppressive activities. Binding of the Fas ligand sequence to Fas on the surface of cells expressing Fas induces apoptosis in the cells. The fusion protein can be used in the treatment of diseases with which Fas expressing cells are associated, such as liver cell necrosis produced by viral hepatitis, and autoimmune diseases. The present sequence represents a fusion protein of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is Fas ligand (FasL) mutant delta 3. This protein was made by deleting amino acids 126-145 (inclusive) of the wild-type FasL sequence AAV28594. The FasL protein activates the Fas receptor which indices apoptosis. The FasL deletion mutants (AAV28595-Y28597) are non-cleavable. The mutations inhibit the proteolytic cleavage of FasL and have the capacity to activate a Fas receptor-mediated pathway.

Claimed mutants of FasL or an organ or tissue expressing a mutant can be used to alleviate symptoms of a fas receptor-mediated by inadequate or inappropriate stimulation of a Fas receptor-mediated pathway, such as the proteorist, in a tissue or organ. In particular, FasL mutants can be used to treat intolerance to a graft in a patient. The FasL mutants protect can organ or tissue from autoimmune destruction.

CC Note: The present sequence is not shown in the specification but it has been derived from the wild-type FasL sequence AAV28594 shown in the
                                                                                                                                                                                                                                                                                                                                                Key

The present sequence represents a non-cleavable Fas ligand 1306145 deletion mutain. Fas ligand deletion mutein can be expressed in cells transfected with the DNA (AAV32623) coding for the mutant protein. These cells, expressing the mutant Fas ligand in a non-cleavable form, are claimed to be useful in vitro to identify cells that express Fas and, in vivo or in vitro, for reducing proliferation of Fas-expressing cells. The DNA encoding the Fas ligand mutant is claimed to be useful in gene therapy procedures and for the treatment of autoimmune diseases, e.g. multiple sclerosis, erythematosus, rheumatoid arthritis, glomerulonephritis, myasthenia gravis and transplant rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New DNA encoding Fas ligand agonist including, e.g. deletion useful for, e.g. treating auto-immune diseases or transplant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       These cells, expressing the mutant Fas ligand in a non-cleavable form, are claimed to be useful in vitro to identify cells that express Fas and, in vivo or in vitro, for reducing proliferation of Fas-expressing cells. The DNA encoding the Fas ligand mutant is claimed to be useful in gene therapy procedures and for the treatment of autoimmune diseases, e.g. multiple sclerosis, erythematosus, rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a non-cleavable Fas ligand 1306142 deletion mutein. Fas ligand deletion mutein can be expressed in cells transfected with the DNA (AAV22622) coding for the mutant protein.
A non-cleavable Fas ligand polypeptide Fas receptor-mediated apoptosis
                                                                                                                               07-JAN-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is Fas ligand (FasL) mutant delta 2. This protein was made by deleting amino acids 126-135 (Inclusive) of the wild-type FasL sequence AAY28594. The FasL protein activates the Fas receptor which induces apoptosis. The FasL deletion mutants (AAY28595-Y28597) are non-cleavable. The mutations inhibit the proteolytic cleavage of FasL and have the capacity to activate a Fas receptor-mediated pathway. Claimed mutants of FasL or an organ or tissue expressing a mutant can be used to alleviate symptoms of a disorder characterized by inadequate or inappropriate stimulation of a Fas receptor-mediated pathway, such as apoptosis, in a tissue or organ. In particular, FasL mutants can be used to treat intolerance to a graft in a patient. The FasL mutants protect an organ or tissue from autoimmune destruction.

Note: The present sequence is not shown in the specification but it has been derived from the wild-type FasL sequence AAY28594 shown in the
This sequence is Fas ligand (FasL) mutant delta 1. This protein was n by deleting amino acids 126-129 (inclusive) of the wild-type FasL sequence AAY28994. The FasL protein activates the Fas receptor which induces apoptosis. The FasL deletion mutants (AAY28595-Y28597) are

                                                        The present sequence is a protease-resistant Fas ligand derivative in which a region of human Fas ligand which is susceptible to protease attack has been deleted. The present invention also describes apoptosis modulators containing soluble Fas ligand. The modification in the Fas ligand renders it resistant to the action of proteases such as the metalloproteinase which in vivo cleaves the active membrane-bound Fas ligand (which is active as an apoptosis inducer). The Fas ligand can be used for the prevention and treatment of diseases such as cancer, viral infection and autoimmune disease, e.g. by introduction of DNA encoding the modified Fas ligand into effector cells using a suitable gene
                                                                                                                                                                                                                                                                                                                                                                                                                Claim 4; Page 48-49; 60pp; Japanese

The mutations inhibit the proteolytic cleavage of FasL and have the capacity to activate a Fas receptor-mediated pathway. Claimed mutants of FasL or an organ or tissue expressing a mutant can be used to alleviate symptoms of a disorder characterized by inadequate or inappropriate stimulation of a Fas receptor-mediated pathway, such as apoptosis, in a tissue or organ. In particular, FasL mutants can be used to treat intolerance to a graft in a patient. The FasL mutants protect an organ or tissue from autoimmune destruction.

                                                                         expressed
                                                                                 screened with a murine Fas-L probe. Isolated clones were amplified by PCR, and a desired fragment ligated into vector pBluescript SK. The cDNA insert of recombinant vector Fas-L/pBS, deposited as E. coli ATCC 69527, is given in AAQ91311. Recombinant Fas-L was

(1) has virucide activity and can be used in vaccines. (1) cc may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, cc particularly when compared to the use of whole antigens in vaccine cc compositions. There is evidence that the immune response to whole callowing for immune escape due to mutations. The groups for inclusion in cc an group-based vaccine may be selected from conserved regions of viral or ct undour-associated antigens, which therefore reduces the likelihood of cescape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the present convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC The present invention describes a composition (I) comprising a prepared CC human immunodeficiency virus-1 (HIV-I) group comprising an amino acid CC sequence selected from 51 defined amino acid sequences (ABL25347 to CC ABP25397). (I) has virucide activity and can be used in vaccines. (I) CC may be used for immunising subjects against HIV-I infections. The use of CC group-based vaccines has several advantages over traditional vaccines, CC particularly when compared to the use of whole antigens in vaccine CC antigens is directed largely toward variable regions of the antigen, CC allowing for immune escape due to mutations. The groups for inclusion in a group-based vaccine may be selected from conserved regions of viral or CC tumour-associated antigens, which therefore reduces the likelihood of CC escape mutants. Furthermore, immunosuppressive groups that may be present CC in whole antigens can be avoided with the use of group-based vaccines. CC and additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the CC composition of the groups, achieving, for example, enhanced composition for the target disease. Similar engineering of the response can be modulated, as continuogenicity. Accordingly, the immune response can be modulated, as continuogenicity. Accordingly, the immune response can be modulated, as continuogenicity and traditional approaches. ABP11501 to ABP25412 convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the treatment of allergic conditions including atopic allergies, e.g. hay fever, asthma, atopic dermatitis, food allergies and allergies to dust, pollen, mold, pet dander or pet hair. The current sequence represents a cathepsin S inhibition assay substrate peptide.
           The invention relates to a purified polypeptide having luciferase activity and a recognition site specifically cleavable by a protease, where cleavage results in a decrease in luciferase activity. The polypeptide comprises a localisation sequence which is linked to the luciferase polypeptide by the cleavable recognition sequence. The polypeptide is useful for identifying a protease (Caspase-3) activity modulator, an inhibitor of apoptosis and for detecting luciferase activity in a sample. The polypeptide is used for characterising and identifying cellular processes associated with metabolism, cell growth and cell death e.g. apoptosis and for measuring protease activity. The protease measurement methods are useful for characterising, identifying cellular blochemical pathways as well as identifying diagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the treatment of allergic conditions, comprisi the administration of a pyrazole derivative. The activity of derivative of the invention may be described as, antiallergic, antiasthmatic and dermatological. They act as cathepsin S inhibitors and may be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAE19118;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAE19118 standard;

nucleic acid construct of the invention is useful for uncovering molecules having antiviral activity or for determining viral drug resistance and the chimeric peptide is also useful for detecting the presence of a virus in a cell. Other uses of the invention are detecting viral encoded protease found in infected cells or detecting the presence or absence of viral infection. The nucleic acid construct is useful for phenotypic testing of human immunodeficiency virus (HIV) drug resistance for invention enables screening of molecules in an easy and rapid manner The present invention relates to a new nucleic acid construct that comprises a polynucleotide cassette encoding a chimeric polypeptide. The chimeric polypeptide comprises a first polypeptide sequence, a second polypeptide sequence translationally fused to the first sequence, and a protease recognition site (PRS) cleavable by a virally encoded protease, where cleavage of the PRS leads to a detectable signal. cc human immunodeficiency virus-1 (HTV-1) group comprising an amino acid composition of the sequence selected from 51 defined amino acid sequences (ABLZ3347 to CABPZ3397). (I) has virucide activity and can be used in vaccines. (I) CC may be used for immunising subjects against HTV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, CC particularly when compared to the use of whole antigens in vaccine CC compositions. There is evidence that the immune response to whole CC antigens is directed largely toward variable regions of the antigen, CC allowing for immune escape due to mutations. The groups for inclusion in CC an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of CC escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines.

CC An additional advantage of an group-based vaccine approach is the ability the

The construct is specific, sensitive and lacks background enzymatic activity in the absence of human immunodeficiency virus protease, and is suitable for detection of specific viral strain isolates even under low viral load conditions. When used for phenotypic testing of HIV drug resistance it delivers accurate results within 24 hours. The present amino acid sequence represents one of several (AAU75794-AAU75798) HIV Gag protein protease cleavage

                                                                                             The present sequence is a peptide used as substrate for a cathepsin S inhibition assay. The Km for the substrate is around to sum but the presence of substrate inhibition makes kinetic analysis difficult. With 20 uM substrate, the assay rate is linear over the range of 1-8 ng cathepsin S in 100 ul reaction. Using 2 ng/well of cathepsin S, the production of product is linear and yields about 7-fold signal after 20 min with only 20% loss of substrate. Primary assays are run by quenching the reaction after 20 min and then measuring the fluorescence. For other assays, measurements are taken every min for 20 min. The rate is calculated from the slope of the increase and the percent inhibition is calculated from this. The present invention relates to the use of cathepsin S inhibitors to treat an allergic condition, especially an atopic IgE-mediated allergic condition such as hay fever, asthma, atopic dermatitis or a food allergy candidated. The later allerges may include dust, pollen, mould, and pet

                                                                               Query Match
                                                                                                                                                                of a ricin-like protein in a novel recombinant protein. A nucleic acid (see AAT97900) encoding such a construct is obtained by PCR mutagenesis of the wild-type ricin linker sequence. The invention provides novel recombinant proteins which incorporate the A and B chains of a ricin-like toxin (preferably the A and B chains of ricin) linked by a heterologous linker sequence containing a cleavage recognition site for a retroyiral protease such as HIV protease (see AAM36880-82), HTLV-I (see AAM36883-43) or HTLV-II (see AAW36885-65). The recombinant proteins selectively inhibit or destroy mammalian cells infected with a retroyirus such as cancer cells associated with HTLV or cells associated with HTLV. The recombinant proteins are non-toxic until the ricin A chain is liberated from the B chain by a retroyiral protease, and thus can

                                                                                                                                                                                                                                                                                                               The present invention describes a composition (1) comprising a prepared CC human immunodeficiency virus-1 (HIV-1) group comprising an amino acid Sequences (ABL25347 to CC ABP25397). (1) has virucide activity and can be used in vaccines. (1) CC may be used for immunising subjects against HIV-1 infections. The use of Group-based vaccines has several advantages over traditional vaccines, CC particularly when compared to the use of whole antigens in vaccines. CC compositions. There is evidence that the immune response to whole compositions is directed largely toward variable regions of the antigen, CC allowing for immune escape due to mutations. The groups for inclusion in a group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of CC escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the CC composition of the groups, achieving, for example, enhanced composition of the target disease. Similar regionesing the response can be possible with traditional approaches. ABP11501 to ABP25412 crepresent peptide sequences used in the exemplification of the present convention.

                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a composition (I) comprising a prepared CC human immunodeficiency virus-I (HIV-I) group comprising an amino acid Sequence selected from 51 defined amino acid sequences (ABL25347 to CC ABP25397). (I) has virucide activity and can be used in vaccines. (I) CC may be used for immunising subjects against HIV-I infections. The use of CC group-based vaccines has several advantages over traditional vaccines, CC particularly when compared to the use of whole antigens in vaccine CC compositions. There is evidence that the immune response to whole CC antigens is directed largely toward variable regions of the antigen, CC allowing for immune escape due to mutations. The groups for inclusion in CC an group-based vaccine may be selected from conserved regions of viral or CC tumour-associated antigens, which therefore reduces the likelihood of CC escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. CC An additional advantage of an group-based vaccine approach is the ability CC composition of the groups (CTL and HTL), and further, to modify the CC composition of the groups, achieving, for example, enhanced CC immunogenicity. Accordingly, the immune response can be modulated, as a properiate, for the target disease. Similar engineering of the response CC is not possible with traditional approaches. ABP11501 to ABP35412

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAR25632-38 are peptides which are hydrolysed by aspartyl proteinase (AP) in the assay of the invention. These peptides have labelled C-terminal portions which are polar. These portions are separated from the unlabelled hydrophobic N-terminal portions by hydrolysis by AP. Following hydrolysis of these peptides with AP, the hydrolysed polar portion is separated from the unhydrolysed polar portion is separated from the unhydrolysed polar portion of a period to the amount of hydrolysed polar portide determined. This assay can be used to detect inhibitors of AP with potential as therapeutic agents, eg. for treating AIDS. This assay has a higher separated the polar period of the period
                                                                                                                                                                                                                   T-cell; epitope; gp160; gag; pol;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sensitivity than previous methods.

(Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assay for retroviral aspartyl proteinase - provides rapid accurate and inexpensive method for detecting aspartyl proteinase inhibitors, e.g. for AIDS treatment
                                                                                                                                                                                                                                                                                                                             T cell epitope, P24M.
                                                                                                                                                                                                                                                                                                                                                                                                         07-SEP-1995

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents the T-cell epitope, P24M, which may be linked to a B-cell epitope from the V3 (MN) loop from HIV-1. These chimeric peptides may then be used in the production of HIV-1 vaccines. These peptide sequences may also be used in the production of multimeric peptides in which the linear peptides are C-terminally modified by the addition of a Lys residue which is modified on its epsilon amino acid to carry an additional copy of the peptide molecule. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV virus to human or animal cells or by disturbing the 3D organisation of the virus.

                                                                   The invention relates to a novel immunogenic composition for use in vaccines for the treatment of HIV-1 comprising an HIV-1-derived T-cell epitope linked to an HIV-1-derived B-cell epitope. The T-cell epitopes are generally designed based on the p24 core protein and the B-cell epitopes from the V3 loop of the gp120 protein from various HIV-1 strains. This peptide is a T-cell epitope derived from the HIV-1 strain
